# Your EnneadTab is added but not yet registered.
Just go here to register it.

Q:
Why?

A:
You added EnneadTab for Rhino.rui file, which is a shared file. By Default, when you close your Rhino, your Rhino will attempt to save to this shared .rui file, which could fail if someone else is saving at the same time.

By (Get Latest), you registered a personal .rui so no conflict will happen. This also allows me to publish updates directly to your personal .rui so you still get the updates as normal.
