Welcome, Beta Testers!

After you have activated the new EnneadTab, you will notice there are different tabs on top.
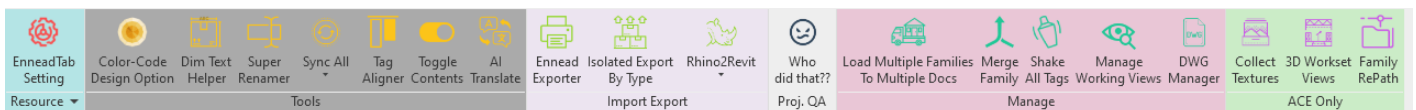

EnneadTab_Basic   EnneadTab_Advanced   EnneadTab_Tailor   Ennead Library   EnneadTab_Beta

It looks a lot, so be sure follow the step below to customize it to your need.

#1, Open EnneadTab Setting from the Resource panel.
#2, At the Ribbon Tabs setting, check/uncheck the tabs per your preference.
#3, Click "Save setting and Close Window".
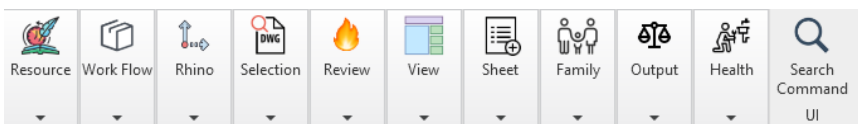

Now you will see a simpler ribbon layout.

Basic Tab:
This is the core functions that every EnneadTab Revit user will have, regardless of the beta tester status. The selection of those tools are based on previous survey, and will receive less updates. Many previously scattered buttons are redesigned to compact UI window now so you will likely to find most of the previous tab function in here.
Advanced Tab:
Those will be exposed only to beta testers and power users. You might notice it inherits the appearance from previous EnneadTab. Tools in here are all functional, but are excluded from basic for now to keep basic version slim. The icon and button location might change in the future as functions are combined and moved to the basic.

Tailor Tab:
Those will be optional for any user. Here is where the personal and project buttons stay. If you didn't order anything, you might choose to hide this tab. The icon and button location might change in the future as functions are combined and moved to the basic.

Library Tab:

Those will be optional for any user. Here is where the loadable revit contents stay. If you didn't plan to load anything, you might choose to hide this tab. The icon and button location might change in the future as this tab is being organized.
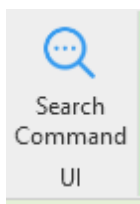

Beta Tester Tab:

Those will be optional for beta tester. When we decide to move forward new buttons from advanced to basic, here is the staging location. Beta testers like you will be directed to do their final checks and give feedbacks. You have the option to hidden this tab when we are not testing new buttons.

What will happen to the classic EnneadTab:

After the basic tab is proved ok, the classic enneadtab will be archived, and extension folder will be replaced with enneadtab_basic. Non-beta-testers will transition to new system automatically.

There are too many buttons, I dont know where is where:

The basic tab should cover the most common function. But when in question, search from this tool is a good way to find functions (located in basic tab). This allow you to search among button names and its documentation string. You might identify the actual button location in the first line of info, or just activate tool on spot.

Minimize it to save screen space when not using.

Search among revit command and enneadtab command

Type in here to search

Use up/down arrow key to navigate.

Button icon, button location on toolbar.
